

Type of Earring Backs

SCREW BACKS

The most secure type of earring back is the screw back. It consists of a threaded post and a nut that is spun onto the post up to the back of the ear lobe. It cannot be pulled off- it has to be fully unscrewed. This is both a blessing and a curse - much less likely that you will lose an earring, but more time-consuming putting them on and taking them off. Screw backs therefore tend to be a good option only for high-value earrings. They offer a strong, secure hold for earrings

PUSH BACKS

Pushbacks, also known as butterfly backs, are a common type of earring back used for securing stud earrings in pierced ears. They are widely popular due to their simplicity and ease of use. This earring back style comprises a small, flat piece attached to a post, with a butterfly-shaped metal piece that slides onto the post to hold the earring in place.

They are suitable for a wide range of earring styles, including small delicate pieces and larger statement designs. The push-back earring back design is ideal for users who prioritize convenience and quick attachment when putting on or removing their earrings.

To wear push-back earrings, simply slide the earring post through the pierced hole in your earlobe, and then push the butterfly-shaped metal back onto the post. The serrated edges of the butterfly back grip onto the earring post, providing tension to keep the stud in place. Adjust the position of the pushback to ensure a comfortable and secure fit.

In conclusion, pushbacks are a practical and secure option for those who wear stud earrings with pierced ears. They provide a comfortable fit, are easy to put on and remove, and are suited for a wide variety of earring designs.

You may choose any of the earring backs among these popular choices as per your choice and comfort. Their design minimizes any irritation or discomfort around the piercing site, making them suitable for sensitive ears. However, it is essential to keep your earring backs and stud earrings clean and sanitized, as dirt or bacteria can collect between the back and the earring post. Regular cleaning with appropriate cleaning solutions and gentle scrubbing can help maintain the hygiene of your earrings and earring backs.
